Introducing...

The DrySyn Water manifold

The new water manifold from Asynt maximises your fume cupboard coolant use by converting a single water tap into three condensing streams and into one drain.

It is equally effective linked to a re-circulating chiller and avoids òdaisy chainingó multiple condensers, keeping everything very tidy.

Details:

The quick release connectors enable rapid reaction set up/ dismantling and form a seal on both sides when removing condenser tubing, diverting the coolant flow to the other connected condensers thus avoiding leaks.

The unit is designed to be clamped to fume hood scaffolding and will keep condenser tubing out of the way when not in use. It can be rotated through 90 degrees to allow vertical or horizontal alignment.

- Three coolant streams from one outlet
- Quicker reaction set up
- Sealed connectors, no more leaks!
- No “daisy chaining” reactions
- Tidies up your fume cupboard
- Flexible mounting
